INDEX OF REPORTS AND MAPS OF FLOODS
Arizona, Idaho, Nevada, New Mexico, and Oregon

GB
1399.4
C6
P33
v.1

INTRODUCTION

This report is one of three which are indexes of maps, reports, and information related to floods and inundated areas in the Pacific Southwest. The area in each State is the area that is part of the Colorado River basin, the Great Basin, or Pacific Slope basins in California. This report is for Arizona, Idaho, Nevada, New Mexico and Oregon; and the other two are for:

California

Colorado, Utah, and Wyoming.

The index is presented in four categories:

Reports of Flood Events

Flood Frequency Reports

Flood Plain Information Reports and Flood Hazard Reports

Maps of Flood Prone Areas

If a map or report includes parts of two or more States, it is listed under each State. The information in each column may not be applicable to all reports or maps; so some columns will have blank spaces.

The index also contains general information on flood insurance studies and a peak flow file plus addresses and phone numbers of offices where copies of the reports and maps may be obtained or examined if out of print.

Information for this report was furnished in the spring of 1978. If the reader knows of other reports or maps that should be included, please furnish the appropriate information to the Water and Vegetation Management Subcommittee, Pacific Southwest Inter-Agency Committee.

REPORTS ON FLOOD EVENTS

This category is subdivided into Formal Reports and Informal Reports. Formal Reports are those published and with a fairly wide distribution. Many are available in libraries of the larger cities and universities. Copies of the more recent reports are often available from the reporting agency.

Informal Reports are those published in limited numbers, unpublished reports in loose leaf, letter, or memo form, and some newspaper articles.

The reports are of floods that have occurred. They may contain information on precipitation, streamflow, flood damage, flood frequency, flood profiles, areas inundated, effects of storage and regulation, sedimentation, and conditions peculiar to that flood.

The list of formal reports is in chronological order. The informal reports are listed alphabetically by locality.

FLOOD FREQUENCY REPORTS

Techniques of flood frequency analysis are still being developed and still involve some degree of subjectivity. Therefore, with only a few exceptions, only reports prepared since 1970 are listed on the premise that longer records, more data sites, and better analytical methods will provide better answers.

FLOOD PLAIN INFORMATION AND FLOOD HAZARD REPORTS

Flood plain information reports and flood hazard reports may be similar to some flood insurance studies, but they were prepared for other purposes and by other agencies.

Explanation of table headings

County If the report covers parts of several counties, the report is listed under each county.

Community or reach Name of city or town or the reach of stream involved.

Streams The name of the principal stream or streams.

Flood area delineated The flood area delineated is described in one of three ways: The year in which the flood occurred; the frequency at which the area is expected to be flooded, expressed as a recurrence interval in years, 100-year, for example; or by the letters OCC which indicate that the area delineated will be flooded occasionally every 25 to 50 years.

Reliability Three descriptors are used to rate the reliability of each report. RECON indicates reconnaissance methods were used; that is, boundaries were approximated without making field surveys or detailed hydraulic and hydrologic analyses. STANDARD means that the areas delineated were based on field surveys and detailed hydraulic and hydrologic analyses. HIGH means that detailed surveys and analyses were made and were supported by observed flood information within or adjacent to the flood areas mapped.

Map scale The usual 1:24,000, 1:62,500, or 1:250,000 scales of maps, shown here as 24, 62.5 or 250. Or the number of feet to the inch, shown as 800 ft.

The flood plain information and flood hazard reports are listed alphabetically by county and then relisted alphabetically by community or stream reach.

MAPS OF FLOOD PRONE AREAS

Maps of flood prone areas that have a reliability shown as RECON should be used only to identify areas where flooding may be a problem. Before decisions are made regarding developments near the flood prone area boundaries, detailed studies should be conducted to refine the boundaries of the areas inundated by the 100-year flood.

Explanation of table headings

County If the map covers parts of several counties, the map is listed under each county.

Quadrangle name Name of standard U.S. Geological Survey quadrangle map, either 7.5 or 15 minute.

Flood area delineated The flood area delineated is described in one of three ways: The year in which the flood occurred; the frequency at which the area is expected to be flooded, expressed as a recurrence interval in years, 100-year, for example; or by the letters OCC which indicate that the area delineated will be flooded occasionally every 25 to 50 years.

Reliability Three descriptors are used to rate the reliability of each flood map. RECON, indicates reconnaissance methods were used; that is, boundaries were approximated without making field surveys or detailed hydraulic and hydrologic analyses. STANDARD means that the areas delineated were based on field surveys and detailed hydraulic and hydrologic analyses. HIGH means that detailed surveys and analyses were made and were supported by observed flood information within or adjacent to the flood areas mapped.

Map scale The usual 1:24,000, 1:62,500, or 1:250,000 scales of maps, shown here as 24, 62.5 or 250. Or the number of feet to the inch, shown as 800 ft.

Maps of flood-prone areas are listed alphabetically by county and then relisted alphabetically by quadrangle name.

FLOOD INSURANCE STUDIES

Reports have been prepared for numerous cities, towns, and counties on behalf of the Insurance and Mitigation Division, Federal Emergency Management Agency, by government agencies and consulting firms. These reports generally contain a map showing the area inundated by the 100-year and 500-year floods, flood profiles for floods of selected probabilities, information on historical flooding in the community, and supporting information. The reports are the bases for zoning ordinances and flood insurance rates.

If interested, the reader should contact the city or county engineer or governing body of the community and inquire if a report has been prepared and if so where it may be inspected. Similar information can be obtained by calling the Insurance and Mitigation Division on one or the other of the following toll free numbers.

800-638-6620

800-424-8872

PEAK FLOW FILE

The Water Resources Division, U.S. Geological Survey, maintains an annual peak flow file in computer storage. This file contains the maximum discharge and gage height for each year of record at each gaging station. Computer printouts of these lists may be obtained for a nominal charge through the district offices of the Water Resources Division as well as log Pearson type 3 flood-frequency relations for them. Discuss your request with the NAWDEX (National Water Data Exchange) representative.
